An electric motor is an electrical machine that converts electrical energy into mechanical energy. Most electric motors operate through the interaction between the motor's magnetic field and winding currents to generate force in the form of rotation. Electric motors can be powered by direct current (DC) sources, such as from batteries, motor vehicles or rectifiers, or by alternating current (AC ...

A linear induction motor (LIM) is an alternating current (AC), asynchronous linear motor that works by the same general principles as other induction motors but is typically designed to directly produce motion in a straight line. Characteristically, linear induction motors have a finite primary or secondary length, which generates end-effects, whereas a conventional induction motor is arranged ...

A linear actuator moves a load, which can be an assembly, components, or a finished product, in a straight line. It converts energy into a motion or force and can be powered by pressurized fluid ...

The development of direct (cycloconverters) or indirect frequency inverters operating with natural switching due to the ability of synchronous machines to provide reactive power, has enabled the creation of high performance, reliable variable speed electric drives.. These drives are particularly competitive in relation to competitors' solutions for power ratings over one megawatt.

INDUCTION MOTOR TORQUE-SPEED CHARACTERISTICS. Figure 6.12a illustrates a squirrel-cage rotor of an induction motor that is operating at no load (near synchronous speed). The magnetization current  $I_M$  flowing in the motor's equivalent circuit (Fig. 6.7) creates the net magnetic field  $B_{net}$ . Current  $I_M$  and hence  $B_{net}$  are proportional to  $E_1$ . Since  $E_1$  remains constant with the changes in load, then ...

The property of a substance which opposes the flow of electric current (or electricity) through it is called Resistance OR Resistance is the ability of a circuit which opposes current. Mica, Glass, Rubber, Wood etc. are the examples of resistive materials. The unit of resistance is OHM ( $\Omega$ ) where  $1\Omega = 1V/1A$ . which is derived from the basic electrical Ohm's law =  $V = IR$ .
